                                                                                                                                                                                                                                                   The present sequence represents a partial human interleukin-22 (IL-22) protein. The specification also describes IL-21 polynucleotides and polypeptides. The IL-21 polynucleotide was isolated from a cDNA library of epileptic frontal cortex. IL-21 and IL-22 may be useful in treating deficiencies or disorders of the immune system, by activating or inhibiting the proliferation, differentiation, or mobilization (chemotaxis) of immune cells, treating or detecting deficiencies or disorders of haematopoietic cells, to modulate haemostatic or thrombolytic activity, in treating or detecting autoimmune disorders,
                                                                                                                                                                                      Novel polynucleotides used to develop products for treating e.g. immune disorders, blood disorders, autoimmune disorders, allergies, inflammation, hyperproliferative disorders or infections
                                                                                                                                                                                                                                                                                                                                                      treating asthma (particularly alleggic asthma) or other respiratory problems, to treat and/or prevent organ rejection or graft-versus-host disease (GVHD), to modulate inflammation, to treat or detect hyperproliferative disorders, to treat or detect infectious agents, to differentiate, proliferate and attract cells, leading to the regeneration of tissues, IL-21 and IL-22 may also increase or decrease the differentiation or proliferation of embryonic stem cells and haematopoletic lineage, may be used to modulate mammalian
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ARYPRYLPEAYCLCRGCLTGLFGEEDVRFRSAPVYMPTVVLRRTPACAGGRSVYTEAYVT 120

The present sequence represents a partial human interleukin-22 (IL-22) protein. The specification also describes IL-21 polynucleotides and protein. The specification also describes IL-21 polynucleotides and polypeptides. The IL-21 and IL-22 may be useful in treating of epileptic frontal cortex. IL-21 and IL-22 may be useful in treating of deficiencies or disorders of the immune system, by activating or inhibiting the proliferation, differentiation, or mobilization chemotaxis) of immune cells, treating or detecting deficiencies of haematopoietic cells, to modulate haemostatic or thrombolytic activalry, in treating or detecting autoimmune disorders, treating asthma (particularly allergic asthma) or other respiratory problems, to treat and/or prevent organ rejection or graft-versus-host disease (cVHD), to modulate inflammation, to treat or detect hyperproliferative disorders, to treat or detect infectious agents, to differentiate, proliferate and attract cells, leading to the regeneration of tissues, IL-21 and IL-22 may also increase or decrease the differentiation or proliferation of embryonic stem cells and haematopoletic lineage, may be used to modulate mammalian characteristics.
                                                                                                                                                                                                                                                                                                                                                                                                                                             "Asn39 is a potential N-linked glycosylation site"

The present sequence is the mature human transforming growth factor beta 9, designated Ztgf beta-9. This is a mature sequence excluding the signal sequence extending from amino acid 17 to and including amino acid 202 of Ztgf beta-9. Human Ztgf beta-9 was isolated from an arrayed pituitary gland cDNA plasmid library by PCR screening. This can be used to treat a variety of neurodegenerative diseases such as amyotrophic lateral sclerosis (ALS), Alzahemer's disease, Huntington's disease, Parkinson's disease and peripheral neuropathies, or demyelinating diseases including multiple sclerosis. Ztgf beta-9 peptides have antiviral activity and may also be used to requlate the proliferation, differentiation and apoptosis of neurons, glial cells, lymphocytes,

This is a mature sequence excluding the signal sequence extending from amino acid 18 to and including amino acid 202 of Zigf beta-9. Human Zigf beta-9 was isolated from an arrayed pituitary gland cDNA plasmid library by PCR screening. This can be used to treat a variety of neurodegenerative diseases such as amyotrophic lateral sclerosis (ALS), Alzheimer's disease, Huntington's disease, Parkinson's disease and peripheral neuropathies, or demyelinating diseases including multiple sclerosis. Zigf beta-9 peptides have antiviral activity and may also be used to regulate the proliferation, differentiation and apoptosis of neurons, glial cells, lymphocytes, hematopoietic cells and stromal cells.
                                                                                                                                                                    Human transforming growth factor beta-9; Ztgf beta-9; Alzheimer's disease; heurodegenerative disease; Huntington's disease; amyotrophic lateral sclerosis; ALS; Parkinson's disease; peripheral neuropathy; demyelinating disease; multiple sclerosis;

                                                                                                                                                                                                                                                               The present sequence is the mature human transforming growth factor beta-9, designated Ztgf beta-9. This is a mature sequence excluding the signal sequence extending from amino acid 16 to and including amino acid 202 of Ztgf beta-9. Human Ztgf beta-9 was isolated from an arrayed pitultary gland cDNA plasmid library by PCR screening. This can be used to treat a variety of neurodegenerative diseases such as amyotrophic lateral sclerosis (ALS), Alzheimer's disease, Huntington's disease, Parkinson's disease and peripheral neuropathies, or demyelinating diseases including multiple sclerosis. Ztgf beta-9 peptides have antiviral activity and may also be used to regulate the proliferation, differentiation and apoptosis of neurons, glial cells, lymphocytes, hematopoietic cells and stromal cells.

                                                                              RYLPEAYCLCRGCLTGLFGEEDVRFRSAPVYMPTVVLRRTPACAGGRSVYTEAYVTIPVG 124
                                                                                                          The present sequence is a mature variant human transforming growth factor beta-9 protein, designated 2tgf beta-9. Human Ztgf beta-9 was isolated from an arrayed pituitary gland cDNA plasmid library by PCR screening. This can be used to treat a variety of neurodegenerative diseases such as amyotrophic lateral sclerosis (ALS), Alzheimer's disease, Huntington's disease, Parkinson's disease and peripheral neuropathies, or demyelinating diseases including multiple sclerosis. Ztgf beta-9 peptides have antiviral activity and may also be used to regulate the proliferation, differentiation and apoptosis of neurons, glial cells, lymphocytes, hematopoletic cells and stromal cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   5 ARAVLSAFHHTLQLGPREQARNASCPAGGRPADRRFRPPTNLRSVSPWAYRISYDPARYP 64

The polypeptide is an IL-17-like (CTLA-8 related) protein. It is a member of a new group of interleukins, IL-170 polypeptides. The members comprise IL-172, IL-173, IL-174, IL-177, and IL-171. IL-170 protein can be used to treat abnormal proliferation e.g. cancer or degenerative conditions. Antibodies can be used in diagnostic methods to detect over production of IL-170 protein in cells or body

                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                           The present sequence represents an interleukin (IL)-173 polypeptide. It is a mammalian homologue of the cytokine designated CTLA-8 (also referred to as IL-17). The specification also describes homologues IL-171, IL-172, IL-173, IL-173, IL-174, IL-176, and IL-177. The DNA sequence encoding IL-171 is useful for identifying genes, mRNA and sequence encoding IL-171 is useful for identifying genes, mRNA and IL-171 protein, antibodies against IL-171, and compounds which have binding affinity to IL-171 are useful in treatment of conditions associated with abnormal physiology or development, including abnormal proliferation, e.g. cancerous conditions, or degenerative conditions. The IL-171 protein can be used in kits and assay methods for identifying compounds that selectively bind to IL-171.
                                                                                                                                 New DNA sequence encoding a mammalian homolog of CTLA-8, designated interleukin-171 (IL-171), useful for recombinant production of IL-171 which can be used for treating conditions associated with abnormal

The present sequence is the human transforming growth factor beta-9, designated 2tgf beta-9. Human 2tgf beta-9 was isolated from an arrayed pituitary gland cDNA plasmid library by PCR screening. This can be used to treat a variety of neurodegenerative diseases such as amyotrophic lateral sclerosis (ALS), Alzheimer's disease, Huntington's disease, Parkinson's disease and peripheral neuropathies, or demyelinating diseases including multiple sclerosis. 2tgf beta-9 peptides have antiviral activity and may also be used to regulate the proliferation, differentiation and apoptosis of neurons, glial cells, lymphocytes, hematopoietic cells and stromal cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human transforming growth factor beta-9; Ztgf beta-9; Alzheimer's disease; neurodegenerative disease; Huntington's disease; amyofrophic lateral sclerosis; ALS; ParKinson's disease; peripheral neuropathy; demyelinating disease; multiple sclerosis; antiviral; cytostatic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         RYLPEAYCLCRGCLTGLFGEEDVRFRSAPVYMPTVVLRRTPACAGGRSVYTEAYVTIPVG 124

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                The present sequence is a variant of human transforming growth factor beta-9, designated 2tgf beta-9. Human 2tgf beta-9 was isolated from an arrayed pituitary gland cDNA plasmid library by PCR screening. This can be used to treat a variety of neurodegenerative diseases such as amyotrophic lateral sclerosis (ALS), Alzheimer's disease, Huntington's disease, Parkinson's disease and peripheral neuropathies, or demonstrating diseases including multiple sclerosis. Ztgf beta-9 peptides have antiviral activity and may also be used to regulate the proliferation, differentiation and apoptosis of neurons, gilal cells, lymphocytes, hematopoietic cells and stromal cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; Interleukin-17D ligand; IL-17D; agonist; antagonist; PRO21175; DNA 173894-2947; systemic lupus erythematosus; rheumatoid arthritis; obsteoarthritis; diabetes mellitus; allergic disease; asthma; demyeelinating disease; degenerative cartilaginous disorder; transplantation associated disease.

degenerative cartilaginous disorder comprises administering a PRO1031 or PRO1122 polypeptide agonist, or antagonist to the mammal. Numerous examples of the diseases and disorders are given in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence represents an interleukin-173 (IL-173) polypeptide. The polypeptide is an IL-17-like (CTLA-8 related) protein. It is a member of a new group of interleukins, IL-170 polypeptides. The members comprise IL-172, IL-173, IL-174, IL-176, IL-177, and IL-171. IL-170 protein can be used to treat abnormal proliferation e.g. cancer or degenerative conditions. Antibodies can be used in diagnostic methods to detect over production of IL-170 protein in cells or body

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence represents an interleukin (IL)-173 polypeptide. It is a mammalian homologue of the cytokine designated CTLA-8 (also referred to as IL-17). The specification also describes homologues LL-17, IL-172, IL-173, IL-173, IL-174, IL-176, and IL-177. The DNA sequence encoding IL-171 is useful for identifying genes, mRNA and coDNA molecules which code for related or homologous proteins. The LL-171 protein, antibodies against IL-171, and compounds which have binding affinity to IL-171 are useful in treatment of conditions associated with abnormal physiology or development, including abnormal proliferation, e.g. cancerous conditions, or degenerative conditions. The IL-171 protein can be used in kits and assay methods for identifying compounds that selectively bind to IL-171.
                                                                                                                                                Interleukin; IL-171; cytokine; CTLA-8; IL-17; IL-175; IL-172; IL-173;
IL-174; IL-176; IL-177; cell proliferation; cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New DNA sequence encoding a mammalian homolog of CTLA-8, designated interleukin-171 (IL-171), useful for recombinant production of IL-171 which can be used for treating conditions associated with abnormal physiology or development

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence is the mature murine transforming growth factor beta 9, designated 2tyf beta-9. The signal sequence extends from amino acid residues 1 to 22. Murine 2tyf beta-9 was found to be highly expressed in the HCL hypothalamic cell line. This can be used to treat a variety of neurodegenerative diseases such as amyotrophic lateral sclerosis (ALS), Alzheimer's disease, inutington's disease, Parkinson's disease and pertipheral neuropathies, or demyelinating diseases including multiple sclerosis. Ztyf beta-9 peptides have antiviral activity and may also be used to regulate the proliferation, differentiation and apoptosis of neurons, glial cells, lymphocytes, hematopoietic cells and stromal cells.
                                               Murine transforming growth factor beta-9; Ztgf beta-9; Alzheimer's disease; neurodegenerative disease; Huntington's disease; amyotrophic lateral sclerosis; ALS; Parkinson's disease; peripheral neuropathy; demyelinating disease; multiple sclerosis;

                             The present sequence represents an interleukin-173 (IL-173) polypeptide. The polypeptide is an IL-17-1ike (CTIA-8 related) protein. It is a member of a new group of interleukins, IL-170 polypeptides. The members comprise IL-172, IL-173, IL-174, IL-177, and IL-171, IL-170 protein can be used to treat abnormal proliferation e.g. cancer or degenerative conditions. Antibodies can be used in diagnostic methods to detect over production of IL-170 protein in cells or body

q

immediate-early protein 2 - saimiriine herpesvirus 1 (strain 11)

N.Alternate names: hypothetical protein ORF13

C.Species: sahimiria herpesvirus 1

A.Note: host Saimirii sclureus (common squirrel monkey)

C.Date: 30-Sep-1993 #sequence_revision 30-Sep-1993 #text_change 16-Jul-1999

C.Accession: B45351; D36807

R.Nichology 179, 189-200, 1990

A.Title: Gene expression in cells infected with gammaherpesvirus saimiri: properties A.Recession: B45351; MUID:91021021

A.Molecule type: mRNA

Interfector Cytckine Res. 16:611-617(1996).

-1. FUNCTION: INDUCES STROMAL CELLS TO PRODUCE PROINFLAMMATORY AND HEMATOPOIETIC CYTOKINES (BY SIMILARITY).

-1. SUBGUNIT: HOMODIMER (BY SIMILARITY).

-1. SUBGELLULAR LOCATION: SECRETED.

-1. SIMILARITY: STRONG, TO OTHER MAMMALIAN INTERLEUKIN-17 AND TO HERPESYTRUS SAIMIRI IMMEDIATE EARLY GENE 13 PROTEIN.

-1. CAUTION: MAS ORIGINALLY (REF.1) THOUGHT TO BE FROM MOUSE BUT, ON THE BASIS OF SUBSEQUENT WORK (REF.2 AND REF.3), HAS BEEN SHOWN TO BE OF RAT ORIGIN.

SIGNATION MEMBER OF THE MULTICOMPONENT NFATC TRANSCRIPTION COMPLEX THAT CONSISTS OF AT LEAST TWO COMPONENTS, A PRE-EXISTING CYTOPLASHIC COMPONENT NFATCS AND AN INDUCIBLE NUCLEAR COMPONENT NFATCI. OTHER MEMBERS SICH AS NFATC4, NFATC3 OR MEMBERS OF THE ACTIVATING PROTEIN-1 FAMILY, MAF, GATA4 AND CBP,300 CAN ALSO BIND THE COMPLEX. NFATC PROTEINS BIND TO DNA AS MONOMERS.
SUBCELLULAR LOCATION: CYTOPLASMIC FOR THE PHOSPHORYLATED FORM AND NUCLEAR AFTER ACTIVATION THAT IS CONTROLLED BY CALCINEURIN-MEDIATED DEPROSPHORYLATION. RAPID NUCLEAR EXIT OF NFATC IS THOUGHT TO BE ONE MECHANISM BY WHICH CELLS DISTINGUISH BETWEEN SUSFAINED AND TRANSIENT CALCIUM SIGNALS. THE SUBCELLULAR LOCALIZATION OF

THE INITIATION OF BLOOD COAGULATION, FIBRINOLYSIS, AND THE GENERATION OF BRADYKININ AND ANGIOTENSIN.

C. I- CATALYTIC ACTIVITY: CLEAVES SELECTIVELY ARG-I-LEE BONDS AND ACTIVATES COAGULATION PACTORS VII AND XI.

C. I- CATALYTIC ACTIVITY: CLEAVES VII AND XI.

C. OADELEA BOOUS: FACTOR XII, PRERALLIKEREIN, AND HUM KININOGEN FORM A COMPLEX BOUND TO AN ANIONIC SURRACE. PRERALLIKEREIN IS CLEAVED BY FACTOR XII TO FORM KALLIKREIN, WHICH THEN CLEAVES FACTOR XII AND THEN TO BETA FACTOR XIIA. ALDHAN-FACTOR

XIIA ACTIVATES FACTOR XIIA AND THEN TO BETA FACTOR XIIA. ALDHAN-FACTOR

XIIA ACTIVATES CONTAINS I FIBRONECTIN TYPE II DOMAIN.

C. I- SIMILARITY: CONTAINS 2 EGF-LIKE DOMAIN.

C. I- SIMILARITY: CONTAINS 1 KRINGLE DOMAIN.

C. I- SIMILARITY: BLONGS TO PEPTIDASE FAMILY S1; ALSO KNOWN AS THE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This SWISS-PROT entry is copyright. Cell. Biol. 6:3312-3319(1986). THE PHOSPHORYLATION ACTIVATES POL2.

-!- MISCELLANEOUS: THREE DISTINCT ZINC-CONTAINING RNA POLYMERASES WERE FOUND IN EUKARYOTIC NUCLEI: POLYMERASE I FOR THE RIBOSOMAL RNA PRECURSOR, POLYMERASE II FOR THE MRNA PRECURSOR, AND POLYMERASE III FOR 5S AND FRNA GERES.
-!- SIMILARITY: BELONGS TO THE RNA POLYMERASE BETA' CHAIN FAMILY. Allison L.A., Wong J.K.-C., Fitzpatrick V.D., Moyle M., Ingles C.J.;
"The C-terminal domain of the largest subunit of RNA polymerase II of
Saccharomyces cerevisiae, Drosophila melanogaster, and mammals: a
conserved structure with an essential function.";
Mol. Cell. Biol. 8:321.329(1988).
-!- FUNCTION: DNA-DEPENDENT RNA POLYMERASE CATALYZES THE TRANSCRIPTION
OF DNA INTO RNA USING THE FOUR RIBONUCLEOSIDE TRIPHOSPHATES AS Pfam; PF00623; RNA_pol_A; 1. Pfam; PF01854; RNA_pol_A2; 1. PROSITE; PS00115; RNA_POL_II_REPEAT; 11. Transferase; DNA-directed RNA polymerase; Transcription; Zinc; Repeat; of the SUBDIVIT: EACH CLASS OF RNA POLYMERASE IS ASSEMBLED FROM TEN TO TWELVE DIFFERENT POLYPEPTIDES. THE 215 KDA POLYPEPTIDE IS THE LARGEST COMPONENT OF ROLE POLYMERASE II.

SUBCELLULAR LOCATION: UNCLEAR.

PTM: THE TANDEM 7 RESIDUES REPEATS CAN BE HIGHLY PHOSPHORYLATED. CATALYTIC ACTIVITY: N NUCLEOSIDE TRIPHOSPHATE = N PYROPHOSPHATE SEQUENCE OF 1-472 FROM N.A.

"Characterization of the EBV/C3d receptor on the human Jurkat T cell line: evidence for a novel transcript.";
J. Immunol. 150:5311-5320(1993).
-!- FUNCTION: RECEPTOR FOR COMPLEMENT C3D AND FOR THE EPSTEIN-BARR VIRUS ON HUMAN B-CELLS AND T-CELLS. PARTICIPATES IN B LYMPHOCYTES
                                                                             SUBCELLUIAR LOCATION: TYPE I MEMBRANE PROTEIN.
ALTERNATIVE PRODUCTS: 2 ISOFORMS; A LONG FORM (SHOWN HERE) AND A
SHORT FORM; ARE PRODUCED BY ALTERNATIVE SPLICING.
TISSUE SPECIFICITY: MATURE B LYMPHOCYTES, T LYMPHOCYTES AND
FOLLIGULAR DENDRITIC CELLG OF THE SPLEEN.
SIMILARITY: TO MOUSE CR2. CD21 IS A MEMBER OF THE REGULATORS OF
COMPLEMENT ACITYATION (RCA) FAMILY.
SIMILARITY: CONTAINS 15 SUSII (SCR) DOMAINS.

-1- ALTERNATIVE PRODUCTS: AT LEAST 4 ISOFORMS; VO (SHOWN HERE), VI, V2 AND V3: ARE PRODUCED BY ALTERNATIVE SPLICING.
-1- TISSUE SPECIFICITY: V2 IS FOUND OULY IN BRAIN.
-1- DEVELOPMENTAL STAGE: DISAPPERAS AFTER THE CARTILAGE DEVELOPMENT.
-1- SIMILARITY: CONTAINS 1 IMMUNOGLOBULIN.LIKE V-TYPE DOMAIN.
-1- SIMILARITY: CONTAINS 2 EGF-LIKE DOMAINS.
-1- SIMILARITY: CONTAINS 1 C-TYPE LECTIN FAMILY DOMAIN.
-1- SIMILARITY: CONTAINS 1 C-TYPE LECTIN FAMILY DOMAIN.
-1- SIMILARITY: CONTAINS 1 C-TYPE SAMILY.
-1- SIMILARITY: CONTAINS 1 SUSHI (SCR) DOMAIN.
-1- SIMILARITY: BELONGS TO THE AGGRECAN/VERSICAN PROTEOGLYCAN FAMILY.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                          US-09-731-816-4
